HOW TO SEND BULK WHATSAPP MESSAGES FROM PC

STEP 1. Import or add your contacts

Click on the upper left on **IMPORT** to import ALL your contacts (recipients of the message you want to send). You have two way to add your contacts (**import from file** or **manual import**)

If you click "Import from file" it will open a new window where you can select and import contacts from **CSV** or **TXT** file. In these files you can have a column with the phone number or two column with name and number (eg. Name, number). You can also have more columns with name, number and other variables.

If you import contacts with name, numbers and variables you will be able to create custom messages with “parts of the message” taken automatically from the imported file.

If you want import a file with multiple variables, this is an **example** of the format of the txt or csv file to use:

As you can see, all fields must be separated by “;”

If you click on **Manual Import** it will open a window where you can add manually your contacts and enter name and mobile number (or mobile numbers only).

Once you add contacts click on **IMPORT**.

STEP 2. Create the Message to send

Now you can start typing the message to send to your contacts (from the central section of the program).

You will be able to create also different “variants” of the message so that your contacts do not receive the same text (this avoids spam and avoids being banned on Whatsapp). Just click on “**Add Message**” button to create a new version for the message.

Over the message window there is a link to add **Emoji** and there are links to automatically add the name and other “*variables*” on the message.

There is also a “**SpinTax**” link: it will allow you to set an array of words with the same meaning or synonyms (e.g Hello, Hi, Hey) and when you send the message, the program randomly will use them. In this way you automatically will send different messages and you will reduce the risk of “ban”.

You can also **select a file** to attach (photo, images, documents or video file) and send with the message.

STEP 3. Send the message

When all contacts are loaded and the message is ready, just click on **SEND** button below.

After clicking on SEND button, it will open this window:

You can send from new fresh session (after login) or send from a saved whatsapp account (do not require login). You can add multiple whatsapp account clicking on ACCOUNTS (on the top menu bar)

After you choose the account and sending mode, WhatSender automatically will open web.whatsapp.com on Google Chrome and you will see a QR code. Scan this QR code with the scanner within WhatsApp. To do so, open WhatsApp on your phone and:

- > On Android: in the **Chats** screen > **Menu** > **WhatsApp Web**.
- > On iPhone: go to **Settings** > **WhatsApp Web**.
- > On Windows Phone: go to **Menu** > **WhatsApp Web**

So, **scan the QR Code** on your computer screen from your phone. Soon after, the Whatsapp message will be sent to all recipients!

Other Features/Settings

Bulk WhatsApp has a very simple and intuitive user interface where all the tools are at your fingertips:

In addition to the basic functions already analyzed such as importing contacts and creating a personalized message, there are other interesting **advanced features and settings** in the program.

GENERATE NUMBERS: If you click on **Imports** → **Generate Numbers** you will be able to create mobile numbers to try to reach. You will have to set a “*start number*” and a “*count*”: the program will generate all numbers as you can see from image below.

CONTACT GRABBER: this feature will allow you to grab all contacts from a selected whatsapp group. Just Open Whatsapp, scan the QR code from your phone, select the group and Bulk WhatsApp will extract all contacts. All contacts will be listed on the “contact grabber” window as you can see from image below.

SETTINGS: If you click on “Advanced sending Settings” on “Settings” button it will open a windows where you will find advanced send option that initiate dialog after “x” amount of messages to **avoid blocking**. You just have to set your familiar Whatsapp accounts and some message dictionary (random message that will be sent to your familiar accounts).

NUMBERS FILTER: this feature will allow you to know, given a list of phone numbers, those that are associated with a Whatsapp account and those that are **not Whatsapp**. Once the function is open, you must load all phone numbers (or use the number generation function) and then click on **START FILTERING**

The software will check all numbers to know that are "Whatsapp" and "NonWhatsapp" accounts.
